<u>In the Specification</u>

Please amend the first paragraph on page 3 to read as follows:

To address the above-mentioned needs, a method and apparatus for generating a translation table is provided herein. The translation table is automatically generated by firstly accessing a domain model and an SCL specification. With access to both domain model and the SCL specification, a translation table is then created that associates elements of domain model to functions and arguments of <u>the</u> SCL specification ~~303~~. Because the translation table is created automatically based on the domain model and the SCL specification, a translation table can be quickly and easily created, with fewer errors than with prior-art techniques.
